Abstract The reaction of α -trialkylgermum (β)-substituted propionic acid with 1-ethoxystannatranе was studied and fifteen organometallic compounds containing germanium and tin were synthesized. The procedure of this reaction was described. The structures of prepared compounds were characterized by means of IR, NMR (^1H , ^{119}Sn) and MS. The fragmentation mechanism of MS was proposed. The tests of biological activity showed that they have better inhibition activity only for some bacteria such as *Beta hemolytic strepto coai* and *Staphylococcus aureus*.

Key words trialkylgermanium, stannatrane, structure characterization, antibacterial activity

1-取代-2,8,9-三氧杂-5-氮杂-1-锡杂三环[3,3,3,0^{1,5}]十一烷(简称1-取代锡杂噁唑烷)是一类具有笼状结构的金属有机化合物,由于其稳定性较差,至今报道很少^[1~3],我们曾经报道过1-芳酰氨基锡杂噁唑烷的合成及结构研究^[4],确证其是一类既含有Sn-N配键,又含有羰基氧同锡原子配位的聚合六配位有机锡化合物。本文以-三芳基锗-(-)-取代锗丙酸同1-乙氧基锡杂噁唑烷进行1-位反应,研究该反应规律,并且制得15个含锗锡的双金属有机化

2 结果与讨论

羧酸同金属杂噁唑烷的 1-位取代反应是合成各类 1-酰氧基金属杂噁唑烷的方法之一, 由于金属杂噁唑烷的稳定性与金属元素密切相关, 相对 Si 和 Ge 来说, 锡杂噁唑烷的稳定性较差, 因此可以不分

离中间体 EtOSn(OCH₂CH₂)N 直接由 Sn (OEt)₄ + N(CH₂CH₂OH)₃ + Ar₃GeCH₂R¹CHR²COOH 一锅法来合成, 产率有明显提高, 另外反应应在 N₂ 保护下进行。

在反应中及时把生成的乙醇排除出体系也是至关重要, 因为反应生成的乙醇有可能同未反应的取代丙酸发生酯化反应^[6]:

化合物的红外光谱数据表明, 它的 Sn N 伸缩振动吸收峰在 459 ~ 489 cm^{-1} 之间, 比类似的 Silatrane 化合物的波数 573 ~ 589 cm^{-1} 低^[6], 这可能是 Sn 原子接受了酰氧基中羰基氧的配位, 使其电子云密度增大, 减弱了 Sn N 的强度。红外光谱中 C = O 基的吸收峰在 1604 ~ 1641 cm^{-1} 范围内, 也大大低于相应的 Silatrane 化合物 (1695 ~ 1718 cm^{-1})^[6], 这进一步说明这类化合物中 O — C = O 基的碳氧键长被平均化。

本类化合物的 $^1\text{H NMR}$ 与相应的含锗 Silatrane 不同^[6], 杂噁唑烷中的 OCH₂CH₂N 并未表现出明显的双三重峰, 而是两个较宽的多重峰, 分别在 2.80 ~ 2.92 和 3.60 ~ 3.70 之间, 这可能是因为锡原子易变形的 5d 空轨道使 Sn 原子同杂噁唑烷中的氧原子也有配位作用, 造成杂噁唑环上三个 OCH₂CH₂N 碳不等价所致。由于 GeCHR¹CHR² 两个 C 原子上的氢质子化学位移有时与噁唑环的 CH₂CH₂N 氢质子的化学位移相重叠, 所以表现为多重峰。

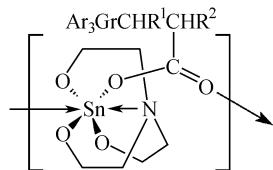

图 1 化合物的结构

Figure 1 The Structure of compounds

^{119}Sn NMR 化学位移值在一定程度上反映出 Sn 原子的配位关系, Sn 原子的配位数增加, ^{119}Sn 的化学位移向高场移动, 下面列出部分化合物的 ^{119}Sn NMR 化学位移数据() (溶剂 DMSO- d_6): 化合物 1 - 544.99; 2 - 544.96; 10 - 544.98; 11 - 544.98; 14 - 545.01。结果表明, 它们均在 - 545 处出现一个单峰, 说明它们在溶剂中只存在一种锡核环境, 可能

是六配位有机锡化合物(见图 1), 这与 IR 和 ^1H NMR 谱的推测相一致, 同时也说明具有强配位能力的 DMSO 并未破坏本类化合物的 C=O-Sn 配位, 使其在溶液和固体时结构保持一致。

化合物的裂解机制见图 2。从图中可以看到它与相应硅杂恶唑烷^[6]明显不同:(1)不存在分子离子峰, 表明该类化合物在质谱条件下, 不如 Silatrane 化合物稳定。(2)本类化合物的裂解首先发生在两个金属键上, 形成三个独立的碎片离子: Ph_3Ge^+ m/e : 305(100%), $\text{Ph}_3\text{GeCH}(\text{C}_6\text{H}_4\text{OCH}_3-p)\text{CH}_2\text{COO}^+$ m/e : 483(2.0%), 和 $\text{Sn}(\text{OCH}_2\text{CH}_2)_3\text{N}^+$ m/e : 266(3.9%)。再由它们继续断裂, 而形成更小的碎片离子峰。化合物的质谱裂解也同样证明该锡杂恶唑烷比相应的硅杂恶唑烷较不稳定。

Acta Chimica Sinica 2002, 60(2), 322

The molecularly imprinted polymer microspheres against 4-aminopyridine (4-AP) and trimethoprim (TMP) were synthesized. Chromatographic analyses showed that the interaction between acidic monomer/polymer and template with amino group mainly depended on the ionic (electrostatic) interaction, but not the simply added interaction.
